Here are the following ways in which I used AI (Claude) in mini-project-3:

In order to help me write the Bootstrap navigation bar code, I asked Claude to help me alter some of the Bootstrap nav-bar code that I found on Bootstrap's website. I explained what I needed my nav-bar to look like, and Claude took me through step by step which pieces to keep from Bootstrap's code and which to get rid of. It also explained to me how Bootstrap JS worked, and how it's different from Bootstrap CSS, and where script code goes on a HTML file, because that was a part of the nav-bar. I also needed help with the hero formatting (I used the jumbotron html I had already written during our in-class demos), because the text and buttons were laid on top of each other and couldn't be read. I had Claude explain what the "position" declaration worked in CSS. I did the same thing for creating the semi-transparent box around the title text and the description text in the hero box, as I tried using the "opacity" declaration and that turned everything, including the background photo, transparent. Claude also helped me fix the formatting of story image one, two and three and make sure they didn't get squished using the object-fit declaration, and Claude explained what this declaration meant/how to use it. I then had Claude check over all of my work at the end, and explain my mistakes to me wherever they were (just small syntax errors).

Lighthouse, which I am not sure if that is artificial intelligence, told me to add underlines to my links so I did that for accessibility purposes.
